Contents

I Challenges of a Precision Engineer

1 Speak the right language 3

1.1 Translate requirements to specifications 3

1.2 Definitions 4

1.2.1 Degrees of freedom 4

1.2.2 Target, true and observed value 5

1.2.3 Resolution 6

1.2.4 Tolerance and allowance 6

1.2.5 Precision, repeatability, reproducibility, trueness and accuracy 7

1.3 Schematic representation 8

1.3.1 Schematic representation of basic elements 9

1.3.2 The use of schematic representations throughout this book 10

2 Comprehend physical effects 13

2.1 Compliance or lack of stiffness 13

2.2 Inertia 14

2.3 Thermal effect 15

2.4 Shortening effect 16

2.5 Play 17

2.6 Friction, stick, spin, slip and sliding 18

2.7 Vibrations 23

2.8 Hysteresis, virtual play and micro-slip 25
2.8.1 Hysteresis . . . 25
2.8.2 Virtual play . . . 26
2.8.3 Micro-slip . . . 28
2.9 Other physical effects 31

3 Select optimal strategies . . . 33

4 Predict system behaviour . . . 39

II Toolbox of a Mechanical Engineer

5 System stiffness . . . 43
5.1 Parallel and series 43
5.2 Effect of a spring at another location 45
5.2.1 Effect of a translational spring at the point of interest . . . 45
5.2.2 Effect of a rotational spring at the axis of interest . . . 46
5.2.3 Effect of a translational spring at the axis of interest . . . 47
5.2.4 Effect of a rotational spring at the point of interest . . . 49
5.3 Energy method 49
5.3.1 How to use the energy method . . . 49
5.3.2 Example: stiffness of a truss . . . 51
5.3.3 Example: stiffness of a shaft . . . 52
5.3.4 Example: stiffness of multiple springs in a circular layout . . . 54
5.4 Systems with a preload 55
5.5 Centre of stiffness 56

6 Element stiffness and loadability . . . 57
6.1 Rotational stiffness for torsion 58
6.1.1 Twisting, warping and stiffening effect . . . 58
6.1.2 Torsional and warping stiffness . . . 60
6.2 Rotational stiffness for bending 66
6.2.1 Cantilever beam subjected to a bending moment . . . 66
6.2.2 Simply supported beam subjected to a moment . . . 66
6.2.3 Composed beam subjected to a moment . . . 67
6.3 Translational stiffness for lateral deformation 71
6.3.1 Cantilever beam subjected to a transverse force . . . 71
6.3.2 Simply supported beam subjected to a transverse force . . . 73
6.3.3 Cantilever beam forced into a straight lateral displacement . . . 74

6.4 Translational stiffness for longitudinal deformation 77
6.4.1 Beam subjected to a longitudinal force 77
6.4.2 Composed beam subjected to a longitudinal force 77
6.4.3 Cantilever beam subjected to eccentric longitudinal force 77
6.4.4 Deformed composed beam subjected to longitudinal force 79
6.4.5 Loadability for compression 81

7 Contact stiffness and loadability 87
7.1 Models for point and line contacts 88
7.2 Approximating stiffness and loadability 89
7.2.1 Transferring variables to a set of parameters 89
7.2.2 Stresses, deformation and stiffness for point contacts 91
7.2.3 Stresses, deformation and stiffness for line contacts 93

8 Parasitic displacement 95
8.1 Parasitic displacement due to shortening 95

9 Static behaviour 97
9.1 Static characteristics 97
9.1.1 Static characteristics of basic elements 97
9.1.2 Static characteristics of some basic systems 98
9.1.3 Total play in systems with multiple springs 106
9.1.4 Example of static characteristic 106
9.2 Systems with micro-slip 111
9.2.1 Micro-slip in a clamp 111
9.2.2 Micro-slip in a bolted joint 115
9.2.3 Micro-slip in a belt drive 115

10 Dynamic behaviour 119
10.1 Free vibration in the time domain 119
10.1.1 Free vibration without damping 119
10.1.2 Free vibration with viscous damping 120
10.2 Forced vibration in the time domain 122
10.2.1 Forced vibration without damping 123
10.2.2 Forced vibration with viscous damping 125
10.3 Forced vibration in the frequency domain 127
10.4 Analysis of damping 128
10.4.1 Relation between damping ratio and specific damping capacity . 129
10.4.2 Relation between damping ratio and decrement for free vibration 130
10.4.3 Relation between damping ratio and 3dB-bandwidth 130

10.4.4 Graphical represenation of ζ in a root locus plot 131

11 Thermal behaviour 133

11.1 Temperature change 133
11.1.1 Effect of change in temperature on homogeneous object 133
11.1.2 Effect of change in temperature on bimaterial object 135
11.1.3 Effect of change in energy on temperature 136
11.2 Energy transfer by heat 137
11.2.1 Thermal radiation 137
11.2.2 Conduction 137
11.2.3 Radiation versus conduction 138

III Design strategies for precision engineering

12 Low stress relationships 141

12.1 Intoduction to degrees of freedom 141
12.2 Design exact-constraint 145
12.2.1 Why design exact-constraint 145
12.2.2 Basic elements for constraining 148
12.2.3 Elements in parallel 151
12.2.4 Elements in series 153
12.2.5 Analysing degrees of freedom 156
12.2.6 Designing degrees of freedom 157
12.2.7 Degrees of freedom exercises 157
12.2.8 Adding redundant constraints 158
12.2.9 Methods for analysing degrees of freedom 159
12.3 Use elastic averaging 159
12.4 Avoid a step in the stiffness 161

13 Minimise deviation 163

13.1 Minimise load on the system 163
13.1.1 Use a force-frame 164
13.1.2 Strive for a constant temperature 164
13.1.3 Neutralise acceleration forces 165
13.1.4 Reduce impact forces 166
13.1.5 Isolate vibrations 166
13.1.6 Minimise friction 167

13.2 Strive for a high stiffness 167
13.2.1 Aim for a favourable transmission ratio . . . 167
13.2.2 Design in parallel . . . 168
13.2.3 Optimise stiffnesses of compliant elements in series . . . 169
13.2.4 Choose a short force path . . . 169
13.2.5 Apply loads in stiff directions . . . 170
13.2.6 Strive for a high torsional stiffness . . . 172
13.2.7 Strive for a high element stiffness . . . 174
13.2.8 Strive for a high contact stiffness . . . 175
13.3 Strive for a low mass 178
13.3.1 Aim for lightweigt and stiff . . . 179
13.3.2 Use two-stage systems . . . 187
13.4 Strive for a high damping 188
13.4.1 Viscous damping . . . 189
13.4.2 Coulomb damping . . . 191
13.4.3 Hysteretic damping . . . 191
13.4.4 Eddy current damping . . . 194
13.4.5 Tuned mass damping . . . 194
13.5 Strive for thermal stability 198
13.5.1 Aim for zero or equal deformation . . . 198
13.5.2 Choose the optimal location for the centre of thermal expansion . 199
13.6 Eliminate or minimise position errors 200
13.6.1 Use symmetric designs . . . 200
13.6.2 Average errors . . . 202
13.6.3 Compensate for undesirable displacement . . . 203
13.7 Optimise measurement and control 204
13.7.1 Use a metro-frame . . . 204
13.7.2 Aim for an optimal measurement . . . 205
13.7.3 Choose optimal position for actuator and sensor . . . 206
13.7.4 Correct the control value . . . 208

14 Prevent relative movement . . . 209
14.1 Avoid (micro-)slip 209
14.1.1 Design monolithic systems . . . 209
14.1.2 Use screwing . . . 210
14.1.3 Use adhesives or welding . . . 210
14.1.4 Avoid difference in strain . . . 211
14.2 Minimise difference in strain 212
14.2.1 Align neutral lines for bending . . . 212
14.2.2 Optimise clamping . . . 212

14.3 Add preload 214
14.3.1 Avoid play . . . 214
14.3.2 Provide preload force . . . 215
14.4 Prevent movement in one direction 216

15 Facilitate relative movement . . . 217
15.1 Avoid all mechanical contact 217
15.1.1 Avoid physical contact using ferrofluid bearings . . . 218
15.1.2 Avoid physical contact using hydrostatic bearings . . . 219
15.1.3 Avoid physical contact using aerostatic bearings . . . 219
15.1.4 Avoid physical contact using magnetic bearings . . . 219
15.2 Use flexure mechanisms 220
15.2.1 Use sheet flexure as hinge . . . 221
15.2.2 Use cross flexures as hinge . . . 222
15.2.3 Use parallel flexures as linear guide . . . 224
15.2.4 Reinforced flexures with mid-section . . . 226
15.2.5 Use notch hinges . . . 226
15.2.6 Aim for low or zero stiffness . . . 229
15.3 Optimise sliding 231
15.3.1 Minimise friction force . . . 231
15.3.2 Minimise the effects of wear . . . 232
15.4 Optimise rolling 234
15.4.1 Rolling bearings . . . 234
15.4.2 Strive for pure rolling . . . 235
15.4.3 Rolling in a hinge . . . 236

16 Manage energy . . . 239
16.1 Store energy 239
16.1.1 Store kinetic energy by using a balance mass . . . 239
16.1.2 Store elastic potential energy by using springs . . . 240
16.1.3 Store potential energy by using a mass and a spring . . . 241
16.2 Dissipate energy 243
16.2.1 Use friction for braking . . . 243
16.2.2 Use eddy current braking . . . 243
16.2.3 Use plastic deformation . . . 243

IV Design concepts for precision designs

17 Linear guiding 247
17.1 Parallel sheet flexures as linear guide 247
17.2 Carriage with V-groove on rail with spindel drive 249
17.3 Carriage with V-groove with magnetic drive, AAE 251
17.4 Slide with ball screw, University of Twente 253
17.5 Conveyor belt for linear motion 253
17.6 Conveyor belt for positioning, Sioux-CCM 257

18 Manipulating and adjusting 261
18.1 Manipulators with a high transmission ratio 261
18.2 Mechanisms with notch hinges 262
18.3 Manipulator for six degrees of freedom 263
18.4 Adjustment in two DOF in a printhead, NTS 264

19 High dynamic positioning 267
19.1 Positioning of crystals, MI Partners 267
19.2 High dynamic manipulating of optical stage, JPE 272

20 Torque transmission 275
20.1 Coupling of suspended shafts with one rod 275
20.2 Coupling of suspended shafts using four flexures 276
20.3 Coupling of suspended shafts with a hollow tie rod 277
20.4 Helical coupling in a printer, Canon 277
20.5 Self centring couplings 278

V Appendices

A Efficiency of beams 283

B Answers to exercises 289
